### **EXPT NO: 2** A python program to implement simple

### DATE:30/08/2024 Regression using Least Square Method

#### AIM:

To write a python program to implement Simple linear regression using Least Square Method.

#### **PROCEDURE:**

Implementing Simple linear regression using Least Square method using the headbrain dataset involve the following steps:

### **Step 1: Import Necessary Libraries**

First, import the libraries that are essential for data manipulation, visualization, and model building.

```
import pandas as pd
import matplotlib.pyplot as plt
import numpy as np
```

## **Step 2: Load the Iris Dataset**

The HeadBrain dataset can be loaded.

```
data = pd.read csv('/content/headbrain.csv')
```

### **Step 3: Data Preprocessing**

Ensure the data is clean and ready for modeling. Since the Iris dataset is clean, minimal preprocessing is needed.

```
x,y=np.array(list(data['Head Size(cm^3)'])),np.array(list(data['Brain
Weight(grams)']))
print(x[:5],y[:5])
OUTPUT:
```

## **Step 4: Compute the Least Squares Solution**

Apply the least squares formula to find the regression coefficients.

```
def get_line(x,y):
    x_m,y_m = np.mean(x), np.mean(y)
    print(x_m,y_m)
    x_d,y_d=x-x_m,y-y_m
    m = np.sum(x_d*y_d)/np.sum(x_d**2)
    c = y_m - (m*x_m)
    print(m, c)
    return lambda x : m*x+c

lin=get_line(x,y)
```

#### **OUTPUT:**

```
3633.9915611814345 1282.873417721519
0.2634293394893993 325.5734210494428
```

#### **Step 5 : Make Predictions**

Use the model to make predictions based on the independent variable.

```
def get_error(line_fuc, x, y):
    y_m = np.mean(y)

y_pred = np.array([line_fuc(_) for _ in x])

ss_t = np.sum((y-y_m)**2)
ss_r = np.sum((y-y_pred)**2)
```

```
return 1-(ss_r/ss_t)
get_error(lin, x, y)

from sklearn.linear_model import LinearRegression
x = x.reshape((len(x),1))
reg=LinearRegression()
reg=reg.fit(x, y)
print(reg.score(x, y))

OUTPUT:

1.0
```

## **Step 6: Visualize the Results**

Plot the original data points and the fitted regression line.

```
x=np.linspace(np.min(x)-100,np.max(x)+100,1000)
y=np.array([lin(x)for x in x])
plt.plot(x, y, color='red', label='Regression line')
plt.scatter(x, y, color='green', label='Scatter plot')
plt.xlabel('Head Size(cm^3)')
plt.ylabel('Brain Weight(grams)')
plt.legend()
plt.show()
```

# **OUTPUT:**

## **RESULT:**

This step-by-step process will help us to implement least square regression models using the HeadBrain dataset and analyze their performance.
